

C++ String Class

Dr. Md. Humayun Kabir
CSE Department, BUET

String

- A string is a sequence of characters.
- We use null terminated character arrays (C-strings or C-style strings) to store and manipulate strings.
- We include `<cstring>` to use C-style string functions, such as `strlen()`, `strcpy` etc.
- ANSI C++ provides a class called **string**.
- We must include `<string>` in our program to create objects from class string

Available Operations on string

- Creating string objects.
- Reading string objects from keyboard.
- Displaying string objects to the screen.
- Finding a substring from a string.
- Modifying string objects.
- Adding string objects.
- Accessing characters in a string.
- Obtaining the size of string.
- And many more.

Commonly Used String Constructors

- `String();`
 - `//` For creating an empty string.
- `String (const char *str);`
 - `//` For creating a string object from a null-terminated string.
- `String(const string &str);`
 - `//` For creating a string object from other string object.

Operator overloaded in string class

Operator	Meaning
=	Assignment
+	Concatenation
+=	Concatenation assignment
==	Equality
!=	Inequality
<	Less than
<=	Less than equal

Operator overloaded in string class

Operator	Meaning
>	Greater than
>=	Greater than equal
[]	Subscripting
<<	Output
>>	Input

Creating String Objects

- `string s1, s3;` `// Using constructor with no arguments.`
- `string s2("xyz");` `// Using one-argument constructor.`
- `s1 = s2;` `// Assigning string objects`
- `s3 = "abc" + s2;` `// Concatenating strings`

- `cin >> s1;` `// Reading from keyboard (one word)`
- `cout << s2;` `// Display the content of s2`
- `getline(cin, s1)` `// Reading from keyboard a line of text`

- `s3 += s1;` `// s3 = s3 + s1;`
- `s3 += "abc";` `// s3 = s3 + "abc";`

Manipulating String Objects

- `string &assign(const string &strob, size_type start, size_type num)`
- `string &assign(const char *str, size_type num)`
- `string &append(const string &strob, size_type start, size_type num)`
- `string &append(const char *str, size_type num)`
- `string &insert(size_type, start, const string &strob)`

Manipulating String Objects

- `string &insert(size_type, start, const string &strob, size_type inStart, size_type num)`
- `string &replace(size_type start, size_type num, const string &strob)`
- `string &replace(size_type start, size_type num, const string &strob, size_type replaceStrat, size_type replaceNum)`
- `string &erase(size_type start=0, size_type num=npos) //npos=-1`

Manipulating String Objects

- `size_type find(const string &strob, size_type start=0) const`
- `size_type rfind(const string &strob, size_type start=npos) const`
- `Int compare(size_type start, size_type num, const string &strob) const`
- `const char *c_str() const`
- `void swap ( string &strob)`

Manipulating String Objects

- `string s1("12345");`
- `string s2("abcde");`
- `s1.insert(4, s2);` `// s1 = 1234abcde5`
- `s1.erase(4, 5);` `// s1 = 12345`
- `s2.replace(1, 3, s1);` `// s2 = a12345e`

String Characteristics

size()	Number of elements currently stored
length()	Number of elements currently stored
capacity()	Total elements that can be stored
max_size()	Maximum size of a string object that a system can support
empty()	Return true or 1 if the string is empty otherwise returns false or 0
resize()	Used to resize a string object (effects only size and length)

String Characteristics

```
void display(string &str)
{
    cout << "Size = " << str.size() << endl;
    cout << "Length = " << str.length() << endl;
    cout << "Capacity = " << str.capacity() << endl;
    cout << "Max Size = " << str.max_size() << endl;
    cout << "Empty: " << (str.empty() ? "yes" : "no") << endl;
    cout << endl << endl;
}
```

Accessing Characters in Strings

Function	Task
at()	For accessing individual characters
substr()	For retrieving a substring
find()	For finding a specific substring
find_first_of()	For finding the location of first occurrence of the specific character(s)
find_last_of()	For finding the location of last occurrence of the specific character(s)
[] operator	For accessing individual character. Makes the string object to look like an array.

Accessing Characters in Strings

- `const char& at ( size_t pos ) const`
- `char& at ( size_t pos )`
- `size_t find_first_of ( const string& str, size_t pos = 0 ) const`
- `size_t find_first_of ( const char* s, size_t pos, size_t n )`
`const`
- `size_t find_first_of ( const char* s, size_t pos = 0 ) const`
- `size_t find_first_of ( char c, size_t pos = 0 ) const`
- `string substr ( size_t pos = 0, size_t n = npos ) const;`

```
cout<<"Thank You"<<endl;
```

```
cout<<"Have a Good Day"<<endl;
```
